

We have structured the Excel file “[Version 1 Database Comprehensive List of all Stakeholders](#)” with separate sheets for each stakeholder category. Each sheet has standardised columns (State, Organisation Name, Stakeholder Type, Mandate, etc.).

Using the data imported from our Excel file, we want to build an interactive, web-based stakeholder database that is searchable, filterable, and includes a map layer.

1) Stakeholder categories ([Excel sheets](#))

- Federal Governments
- MMSD Zonal & State Offices
- State Agencies
- State-owned Companies
- Mining & Geoscience Associations
- Civil Society Organisations
- Mining Training Institutes
- Universities with Mining Departments
- Artisanal Small-Scale Miners (ASM)
- Mining Companies
- NGOs

- Mining Consultancies
- Infrastructure & Supply Chain
- Donors

2) Main page requirements (Directory)

The main page should display stakeholders in a table/list view and include:

Search

- Search across the database (at minimum by **Organisation Name** and **Role/Mandate**).
- Searchable fields should include:
 - Organisation
 - Stakeholder Type
 - Mandate
 - Value Chain Role
 - Jurisdiction
 - State/City
- Summary Functions

- Website

Filters (multi-select where possible)

- Stakeholder Category (as listed above)
- Level (federal / state / national)
- State (36 states + FCT)

Stakeholder Profile

- Clicking a stakeholder should open a Stakeholder Profile page (or a side panel) showing full details, including:
- Mandate
- Value Chain Role
- Jurisdiction
- Summary Functions
- Website

3) Map view requirements

We want a Nigeria map on the platform that can show:

- Stakeholder points by state centroid (we are not using exact location coordinates)
- Search and filters should update both the map and the table/list in real time.

Part 2: Policy Category (to include in the database)

In addition to stakeholder categories, we also want a **Mining Policy Database** linked to the stakeholder directory.

1) Policy Category

We have a dedicated Mineral **Policy Database sheet** in the Excel file with the following columns:

Policy data fields

- Policy Name
- Policy Family / Cluster
- Policy Type
- Year Introduced
- Status
- Jurisdiction
- Policy Summary
- Institutional Responsibility
- Value Chain Stage

- ESG / Due Diligence Elements
- Governance & Political Economy Issues
- Implementation Challenges
- Stakeholders Impacted by the Policy
- Reform Priority
- Links
- Source Type
- Last Verified

2). Policy Database Search

- Policies should be displayed in a **searchable, filterable table/list view**.
- Global search should work across:
- Policy Name
- Policy Summary
- Institutional Responsibility
- Stakeholders Impacted

- Filters should include (multi-select where possible):
- Policy Family / Cluster
- Policy Type
- Jurisdiction (federal/state)
- Value Chain Stage
- Status (active, draft, expired, etc.)
- Reform Priority

3). Policy detail page

Clicking a policy should open a Policy Detail page (or side panel) showing all fields, including:

- Policy summary
- Governance and political economy issues
- Implementation challenges
- ESG / due diligence elements
- Institutional responsibility
- Stakeholders impacted

- Source and external links

4) Linking policies to stakeholders (important)

Where possible, (a simple relational link or tag-based link is fine)

- Policies should be linked to stakeholder profiles (e.g. responsible ministries, regulators, affected groups).
- From a stakeholder profile, users should be able to see related policies.
- From a policy page, users should be able to see responsible or impacted stakeholders.
